

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

**XXXV. Chloranthus, a new Genus of Plants, described by Olof Swartz, M. D. Communicated by Sir Joseph Banks, Bart. P. R. S.**

Read June 21, 1787.

**A**MONG the numberless vegetable productions that have appeared in the Royal Garden at Kew, is the present. It is already long since this curious plant has been introduced there as a native of China, where, we are told, the same is cultivated in the Chinese gardens, though it seems not to have any qualities either palatable or odoriferous, nor a beautiful appearance.

At the first sight of the plant, there is some likeness of *Viscum* or *Loranthus*; and considering the inflorescentia, and the insertion of the antheræ, we find no less analogy; though on a nearer examination it is greatly different, and of a very intricate construction.

The pains I have taken to enucleate the family relation of this hitherto unknown vegetable, have induced me, for the sake of its singularity, to present it as a new genus, of which I think the following natural character may be the most proper:

*Calyx nullus; sed*

*Squama ovata, acuta, concava, cui germen infidens.*

*Corolla monopetala, dimidiata, vel*

*Petalum unicum, subrotundum, trilobum, convexum,  
lateri exteriori germinis insertum, staminiferum, deci-  
duum.*

*Lobus intermedius cæteris major.*

*Stam.* Filamenta nulla.

Antheræ quatuor, marginibus petali longitudinaliter accretæ, bivalves.

*Pist.* Germen oblongum, vel obovatum difforme, squama fere tectum, antice prominens, petaligerum.

Stylus obliquus, crassus, brevissimus, angulatus.

Stigmata tria, minutissima, erecta.

*Per.* Bacca oblonga, monosperma.

*Semen* oblongum.

From this generical description the essential character is formed :

*Calyx* nullus.

*Cor.* Petalum trilobum lateri germinis insidens.

Antheræ petalo accretæ.

*Bacca* monosperma.

This new genus is to be placed in Tetrandria Monogynia with *flores incompleti, superi*, next after *Acæna*; and amongst the *Ordines naturales* I think it would best take its place in the XLVIII. d. next after *Viscum*.

To distinguish this species from others, that may be discovered of the same genus, I have adopted the *nomen triviale* of

*Chloranthus inconspicuus*:

Its specific description is as follows :

*Planta* herbacea.

*Caules* plures ex radice, semipedales, patentes, suberecti, ramosiusculi, teretes, glabri.

*Rami* oppositi, patentes, teretes, striati, glabri.

*Folia* petiolata, decussata, opposita, lanceolato-ovata, margine ferrata, nervosa, venosa, subsucculenta, glaberrima, pallide viridia.

*Petioli*

*Petioli breviusculi, superne canaliculati, glabri.*

*Stipulæ interpetiolares, utrinque denticulis duobus minutis, membranaceæ, persistentes.*

*Flores paniculati.*

*Panicula terminalis, erecta, simplex.*

*Racemi (vel spicæ) oppositi, decussati, erectiusculi, subfastigiati.*

*Flores oppositi, decussati, sessiles, solitarii, minuti, magnitudine capitis aciculæ, subsucculentæ, ex albido lutei.*

*Pollen* flavum.

*Stigma* albida.

*Bacca* nigra, magnitudine piperis.

I have not been able to find any description or figure answering to this plant in the works of the East-Indian naturalists. I have only met with one Chinese drawing, in the library of Sir JOSEPH BANKS, Bart. P. R. S. among some others of their garden plants, that seems to represent the present.

It is said to be called Chu-Lan by the Chinese; but it ought not to be confounded with the Tsjiulang or Camunium Chinense of Rumphius (Herb. Amboin. 1. VII. cap. xv. and Auctuarii ejusd. cap. XLVII.), the description of which seems to correspond in some parts with the Chloranthus: the first figure, however, on the eighteenth plate shews the plant of RUMPHIUS to be the Vitex pinnata of LINNÆUS.

## EXPLANATION OF THE PLATE. (Tab. XIV.)

*The plant* in natural size.

- a.* A part of a racemus with flowers, magnified.
- b.* A flower magnified, separated from the racemus, containing the pistillum, with the petalum inserted on the side of the germen.
- c.* A petalum separately, with its four antheræ inserted on the margins of the lobes.
- d.* The germen without the corolla.
- e.* The germen when in flower, cut transversely, shewing the rudiment of the seed.
- f.* The bacca, cut transversely, with one room and seed, of natural size.
- g.* The form of the seed.

*Chloranthus inconspicuus.*

O. Swartz del.

*Chloranthus inconspicuus.*
